DMC-21x3 Series

Product Description

Galil's DMC-21x3 Ethernet motion controllers are designed for extremely cost-sensitive and space-sensitive applications. The DMC-21x3 controllers are available with a variety of plug-in multi-axis amplifier boards that are designed to eliminate the wiring and any connectivity issues between the controller and drives.

The controllers incorporate a 32-bit microcomputer and provide such advanced features as PID compensation with velocity and acceleration feedforward, pro-

gram memory with multitasking for simultaneously running up to eight programs, and uncommitted I/O for synchronizing motion with external events. Modes of motion include point-to-point positioning, position tracking, jogging, linear and circular interpolation, contouring, electronic gearing and ECAM.

Like all Galil controllers, these controllers use a simple, intuitive command language which makes them very easy to program. GalilTools servo design software further simplifies system set-up with "one-button" servo tuning and real-time display of position and velocity information. Communication drivers are available for Windows, .NET, QNX, and Linux.

DMC-21x3 Series

DMC-21x3 with Metal Enclosure

The DMC-21x3 is available with a metal enclosure. The standard configuration is for a 1 through 4-axis DMC-21x3-DC24 with an attached ICM-20105 packaged in an 8.55" × 5.6" × 1.95" metal enclosure (4-axis part number: DMC-2143-DC24-20105-BOX). Please consult the factory for other packaging options. For example, a DMC-2183 can be packaged with an AMP-20540 and AMP-20440 upon special request.

DMC-2143-DC24 and ICM-20105 packaged in a metal enclosure

I/O Expansion Options

DB-28040 I/O Expansion Board

The DB-28040 mounts directly to the DMC-21x3 50-pin header and provides an additional 40 digital inputs and outputs, and eight analog inputs (default I/O is 3.3 V. For 5 V I/O, order DB-28040-5V). Even with the DB-28040 attached there is still room to mount the ICM-20100, SDM-20240, AMP-20341 or AMP-20440.

The 40 digital I/O signals are available on a 50-pin IDC header, and the analog inputs are available on a 16-pin header. With a controller firmware modification, the I/O board can also be modified to accept feedback from SSI encoders. 2.55" × 3.08".

DMC-2143 4-axis controller with attached DB-28040 and ICM-20100

DB-28104 Sinusoidal Encoder Interpolation Board

The DB-28104 mounts to the DMC-21x3 50-pin header and provides interpolation of up to four 1-volt differential sinusoidal encoders resulting in a higher position resolution. The AF n command selects sinusoidal interpolation where n specifies 2^n interpolation counts per encoder cycle ($n = 5$ to 12). For example, if the encoder cycle is 40 microns, AF10 results in $2^{10} = 1024$ counts per cycle, or a resolution of 39 nanometers per count. Each sinusoidal encoder connects to the DB-28104 through its own 9-pin D-sub connector. 3.510" × 3.075".

DB-28104 mounted on a DMC-2143 controller

RIO-47xxx Pocket PLC

Galil's RIO I/O controller provides an intelligent solution for adding I/O and PLC functionality to the DMC-21x2/21x3 Ethernet control system. The RIO I/O controller connects to the Ethernet network allowing it to communicate with DMC-21x2/21x3 motion controllers and other devices on the network. The intelligent I/O controller has an on-board microprocessor for coordinating I/O events and performing tasks normally handled by a PLC. Each RIO unit provides 8 analog inputs, 8 analog outputs, 16 optically isolated inputs, 8 high-power isolated outputs and 8 low-power isolated outputs.

RIO-47100 remote I/O controller

Distributed Control Option

The DMC-31x3 is a distributed control firmware option for the DMC-21x3 that allows up to eight axes distributed among several DMC-31x3 controllers to be programmed like a single controller. Typically, axes that are close together or that require tightly coupled coordinated motion are controlled by an individual DMC-31x3 controller. For example, an eight axis application might be constructed with two DMC-3143 4-axis controllers, four separate DMC-3123 2-axis controllers, or eight DMC-3113 1-axis controllers.

Communication overhead and motion coordination issues typical with distributed, single-axis systems are minimized with the DMC-31x3 controllers. All motion coordination tasks are performed by the various DMC-31x3 multi-axis controllers in the network. The communication burden with the host PC is minimized because the PC communicates only to the one DMC-31x3 controller configured as the master, which in turn communicates with all other DMC-31x3 controllers on the network. A special set of commands for distributed control ease communication issues on the network.

HC	Automatic handle configuration	ZA	Ethernet user variable
HQ	Handle Query	ZB	Ethernet user variable

DMC-21x3 Interconnect and Drive Options

ICM-20100 Interconnect Module

The ICM-20100 breaks out the 96-pin connector into convenient D-sub connectors for easy interface to external amplifiers and I/O devices. The ICM-20100 provides 15-pin D-sub connectors for each of the four axes and 25-pin D-sub connectors for the auxiliary encoders and I/O. The ICM may be configured for High or Low amp enable. Default is high Amp Enable (-HAEN). For low Amp Enable, order -LAEN. The ICM-20100 mounts directly to the 96-pin connector on the DMC-21x3. 4.25" × 3.70".

ICM-20105 Interconnect with Optically Isolated I/O

The ICM-20105 provides optical isolation for DMC-21x3 inputs and outputs, and breaks out the 96-pin connector into convenient D-sub connectors for easy interface to external amplifiers and I/O devices. The ICM-20105 provides four 15-pin D-sub connectors for each of the four axes, a 37-pin D-sub for the digital I/O, home and limits, and a 25-pin D-sub for the auxiliary encoders. The maximum common voltage for the I/O is 28 VDC. Eight 500 mA highside drive outputs are available (total current not to exceed 3 A). The ICM-20105 is user-configurable for a broad range of amplifier enable options including: High amp enable, Low amp enable, 5 V logic, 12 V logic, external voltage supplies up to 24 V and sinking or sourcing. The ICM-20105 mounts directly to the 96-pin connector on the DMC-21x3. 4.25" × 3.70"

ICM-20500 Interconnect Module for AMP-205x0

The ICM-20500 provides a screw terminal interface for the AMP-205x0. The unit also provides optical isolation on digital inputs and outputs to interface with up to 24V I/O. The first four outputs are high power outputs capable of providing up to 500 mA at up to 24 VDC. The ICM-20500 is also available with D-type connectors instead of screw terminals (order as ICM-20500-DTYPE).

This provides optical isolation of the I/O when using an AMP-205x0. The D-type connectors include four 15-pin HD connectors and one 44-pin HD connector. The pinout of the 15-pin connectors are the same as the AMP-205x0. The 44-pin connections are the same except for the following four signals:

- Pin 9 Output Supply
- Pin 25 Input Common
- Pin 39 Output Return
- Pin 40 Limit Switch Common

ICM-20500 Interconnect Module attached to AMP-20540 Amplifier

AMP-20341 4-axis 20 W Servo Drives

The AMP-20341 contains four linear drives for operating small brush-type servo motors. The AMP-20341 requires a $\pm 12-30$ VDC input.* Output power is 20 W per amplifier or 60 W total. The gain of each transconductance linear amplifier is 0.1 A/V at 1 A maximum current. The typical current loop bandwidth is 4 kHz. The AMP-20341 uses 15-pin D-sub connectors for encoder and limit connections on each axis and a 25-pin D-sub connector for I/O connections. 4.25" × 3.70".

**The default configuration of the AMP-20341 is with J98 removed, which allows operation from a separate dual supply. Specify "install J98" for operation of the AMP-20341 and DMC-21x3 from the same dual supply.*

DMC-2183 8-axis controller with mounted ICM-20100 and AMP-20341

AMP-204x0 2- and 4-axis 200 W Servo Drives

The AMP-20440 contains four transconductance, PWM amplifiers for driving brush-type servo motors up to 200 Watts. Each amplifier drives up to 3.3 Amps at 20–60 VDC (available voltage at the motor is 10% less). No external heat sink is required. The AMP-20440 uses 2-pin Molex connectors for each motor and a 15-pin high density D-sub connector for encoder, limits and home for each axis. A single 44-pin high density D-sub connector is used for additional I/O signals. A 4-pin Molex is used for the DC voltage input from a single DC power supply ranging from 20–60 Volts. A two axis version, the AMP-20420 is also available. 4.95" × 3.75".

AMP-205x0 2- and 4-axis 500 W Servo Drives

The AMP-20540 contains four transconductance, PWM amplifiers for driving brushless or brush-type servo motors. Each amplifier drives motors operating at up to 7 Amps continuous, 10 Amps peak, 18–60 VDC (available voltage at the motor is 10% less). The gain settings of the amplifier are user-programmable at 0.4 Amp/Volt, 0.7 Amp/Volt and 1 Amp/Volt.

The switching frequency is 60 kHz. The amplifier offers protection for over-voltage, under-voltage, over-current, short-circuit and over-temperature. The amplifier status can be read through the DMC-21x3 controller, and the BS command allows easy hall sensor set-up. A 2-axis amplifier board,

Ethernet/RS232 Econo Series, 1–8 axes

DMC-21x3 Series

the AMP-20520 is also available. In a standard configuration the DB-28040 I/O board will not install next to an AMP-20540, however the AMP-20540 provides 8 uncommitted analog inputs with 12-bit ADC (16-bit optional).* The SR-19900 shunt regulator is available for the AMP-20540. 6.92" × 4.85". CE certified

** Please consult factory for special options available when using a DB-28040 with an AMP-20540.*

AMP-20542 4-axis Servo Drive for Low-Inductance Motors

The AMP-20542 contains four transconductance, PWM amplifiers for driving small, low-inductance brush or brushless servo motors. Each amplifier drives motors operating at 18–60 VDC, up to 3.3 A continuous, 5 A peak (available voltage at the motor is 10% less). The drive for each axis is software configurable to operate in either a chopper or inverter mode. The chopper mode is intended for operating low inductance motors. The AMP-20542 offers protection for over-voltage, under-voltage, over-current

AMP-20542 mounted on a DMC-2143 controller

and short-circuit. The amplifier status can be read through the DMC-21x3 controllers, and the BS command allows easy hall sensor set-up. Unlike the AMP-20540, the AMP-20542 does not provide uncommitted analog inputs. The SR-19900 shunt regulator can be used with the AMP-20542. 6.92" × 4.85".

SDM-20242 4-axis Full/Half Stepper Drives

The SDM-20242 contains four drives for operating two-phase bipolar step motors. The SDM-20242 requires a single 12–30 VDC input. The SDM is user-configurable for 1.4 A, 1.0 A, 0.75 A, or 0.5 A per phase and full, half, 1/4 or 1/16 step. Adequate airflow across the board is recommended. The SDM uses 9-pin D-sub connectors for encoder and limit connections on each axis and a 25-pin D-sub connector for I/O connections. 4.25" × 3.70".

Note Regarding Power for AMP and SDM Amplifiers:

The default configuration of the AMP-205xu, AMP-204x0, SDM-20242 and SDM-206x0 amplifiers is to pass their operating voltages to the -DC24 or -DC48 controller supply. If you would like to operate these amplifiers from a separate supply, specify "no J98" on your DMC-21x3 controller and amplifier order. The default configuration of the AMP-20341 is with J98 removed which allows operation from a separate supply. Specify "install J98" for operation of the AMP-20341 and DMC-21x3 from the same dual supply.

SDM-206x0 2- and 4-axis Microstep Drives

The SDM-20640 contains four microstepping drives for operating two-phase bipolar stepper motors. The drives produce 64 microsteps per full step or 256 steps per full cycle which results in 12,800 steps/rev for a standard 200-step motor. The maximum step rate generated by the controller is 3,000,000 microsteps/second. *Correct motor sizing calculations are critical to achieve stepper performance at speed. Please contact Galil for assistance.* The SDM-20640 drives motors operating at up to 3 Amps at 12 VDC to 60 VDC (available voltage at the motor is 10% less). There are four software-selectable current settings: 0.5 A, 1 A, 2 A and 3 A. Plus, a selectable low-current mode reduces the current by 75% when the motor is not in motion. No external heatsink is required. A two-axis model, the SDM-20620 is also available.

DMC-2143 with SDM-20640 microstep drives

5- Through 8-axis Configurations

For the first four axes, any ICM, AMP or SDM may be used. Due to size constraints, for axes 5 through 8 only the ICM-20100, ICM-20105, AMP-20341, AMP-204x0 or SDM-20242 can be used.

Note: The AMP-205x0 and DMC-21x3-DC24 or -DC48 are configured to accept their operating voltages from a single DC supply. If you want to operate the AMP and DMC from two separate supplies, you must remove J98 (10-pin header) on the DMC-21x3 controller. Galil will remove this header upon request if you specify “no J98” on your DMC-21x3 order.
